The specification describes a metal ion-specific, affinity sensor that measures capacitance. The sensor comprises a piece of noble metal to which are bound groups that bind specifically to selected heavy metal ions. These groups are bound to a self-assembling monolayer that covers at least 90% more preferably at least 99% of the noble metal surface. The noble metal is a rod or piece of insulating material (91ass, quartz or silica) on which a noble metal is sputtered. The sensor is used for qualitative or quantitative detection of selected heavy metal ions in liquid samples, particularly of zinc, mercury, cadmium, copper and lead in e.g. environmental samples, medicines, foods and other products.
                                                                                                                                                Sequence
                                                                                                                                                                                                                                       used to transform other bacteria
                                                                                                                                                                                                                                                                              The mercury resistance genes can be used as selectable markers when

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             on:
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                  289

"Mercury operon regulation by the merR gene of the organomercurial resistance system of plasmid pDU1358.";

J. Bacteriol. 171:4241-4247(1989).

1- FUNCTION: MEDIATES THE MERCURIC-DEPENDENT INDUCTION OF MERCURY RESISTANCE OPERON. IN THE ABSENCE OF MERCURY MERR REPRESSES TRANSCRIPTION BY BINDING TIGHTLY TO THE MER OPERATOR REGION; WHEN MERCURY IS PRESENT THE DIMERIC COMPLEX BINDS A SINGLE ION AND BECOMES A POTENT TRANSCRIPTIONAL ACTIVATOR, WHILE REMAINING BOUND TO THE MER SITE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EMBL; Z00027; CAA77320.1; -. -i- FUNCTION: COMPONENT OF THE EXOSOME 3->5 EXORIBONUCLEASE COMPLEX.

REQUIRED FOR THE 3' PROCESSING OF THE 7S PRE-RNA TO THE MATURE
5.8S RRNA. HAS A 3'-5' EXONUCLEASE ACTIVITY (By similarity).

-i- SUBUNIT: COMPONENT OF THE EXOSOME MULTIENZYME RIBONUCLEASE COMPLEX
COMPOSED OF AT LEAST 11 PROTEINS: RRP4, RRP40, RRP41/SK16, RRP42,
RRP43, RRP44/DIS3, PM/SCL-75, RRP46, CSL4 AND PM/SCL-100 (ONLY IN

COFACTOR: Pyridoxal phosphate (By similarity).
PATHWAY: Along with D-alanine-D-alanine ligase, it makes
D-alanine branch of the peptidoglycan biosynthetic route.
SIMILARITY: BELONGS TO THE ALANINE RACEMASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                 Į

"tpr homologues activate met and raf.";
Oncogene 2:617-619(1988).
In FUNCTION: COMPONENT OF THE CYTOPLASMIC FIBRILS OF THE NUCLEAR PORE COMPLEX IMPLICATED IN NUCLEAR PROTEIN IMPORT. ITS AMINO TERMINUS IS INVOLVED IN ACTIVATION OF ONCOGENIC KINASES.
I-SUBCELLULAR LOCATION: CYTOPLASMIC SURFACE OF THE NUCLEAR PORE COMPLEX. THE ASSEMBLY OF THE NPC IS A STEPWISE PROCESS IN WHICH TRP-CONTAINING PERIPHERAL STRUCTURES ASSEMBLE AFTER OTHER COMPONENTS, INCLUDING P62.
I-TISSUE SPECIFICITY: HIGHEST IN TESTIS, LUNG, THYMUS, SPLEEN AND BRAIN, LOWER LEVELS IN HEART, LIVER, AND KIDNEY.

I-I-DISEASE: INVOLVED IN TUMORIGENIC REARRANGEMENTS WITH THE MET, TRK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE-95096166; PubMed-7798308;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
